                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          solation and characterization of the chicken bcl-2 gene: explantion of tissues including lymphoid and neuronal organs
                                                                                                   Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELLUIAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. TISSUE SPECIFICITY: In adult chicken expressed, in thymus, spleen, kidney, heart, ovary and brain, with the highest levels in the thymus. In the embryo, highly levels expressed in all tissues with
DOMAIN: The BH4 domain is required for anti-apoptotic for interaction with RAF-1 (By similarity).
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3) DOMAIN.
                                                                                                                                                                                                                                      the apoptosis-activating factor (APAF-1). SUBUNIT: Forms homodimers, and heterodimers with
                                                                                                                                                                                                                                                                      Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding t
                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Suppresses apoptosis in a variety of cell systems

SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1.
SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoletic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding the

TISSUE SPECIFICITY: Expressed in a variety of tissues.
DOMAIN: The BH4 domain is required for anti-apoptotic activity for interaction with RAF-1.
                                                                                                                                                                                                                                                                                                                           SWISS-PROT entry is copyright. FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, to it and preventing the mitochondrial membrane. The Bcl-x(S)

                                                                                                                                                                                       ALTERNATIVE PRODUCTS: 3 ISOFORMS; BCL-X(L) (SHOWN HERE), BCL-X(S) AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICATY: EXPRESSED IN MOST TISSUES. BCL-X(BETA) IS
SPECIFICALLY EXPRESSED IN CERRBELLOW, HEART, AND THYMUS. IN THE
OVARY, THE PREDOMINANT FORM IS BCL-X(L), WITH A SMALL BUT
                                                                                                                                                                                                                                                                                           cytochrome c, from the mitochondrial membrane. The Bcl-x($) ar Bcl-x(beta) isoforms promote apoptosis.
SUBUNIT: Bcl-x(L) forms heterodimetation with BAX, BAK and Bcl-2 (similarity). Heterodimerization with BAX does not seem to be required for anti-apoptotic activity (By similarity).
SUBCEILULAR LOCATION: MITOCHONDRIAL MEMBRANES AND PERINUCLEAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bcl-2 protein family.";

Proc. Natl. Acad. Sci. U.S.A. 95:554-559(1998).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.

1. TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS
THAT UNDERGO A HIGH RATE OF TURNOVER, SUCH AS DEVELOPING
LYMPHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING
LONG-LIVED POSTMITCTIC CELLS, SUCH AS DUTLE BRAIN.

DOMAIN: The BH4 domain is required for anti-apoptotic activity.
The BH1 and BH2 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death.

PTM: Proteolytically cleaved by caspases during apoptosis That activity.

Cleaved protein, lacking the BH4 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ACTIVITY.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 4
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator.
                                                                                                                                                                                                                                                                                                                                      ; 223116; CAA80662.1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    4 SNRELVV-----DFLSYKLSQKGYSWSQFSDVEENRTEAPEGTESEMETPSAINGNPS
                                                   FUNCTION: Potent inhibitor of cell death. Inhibits activat caspases (By similarity). Appears to regulate cell death b blocking the volatage-dependent anion channel (VDAC) by b to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane.

SUBJUNT: BCL-X(L) forms heterodimers with BAX, BAK and Bcl
                similarity). Heterodimerization with BAX does not seem required for anti-apoptotic activity (By similarity).

-i - FUNCTION: ACCELERATES PROGRAMMED CELL DEATH BY BINDING TO, AND ANTAGONIZING THE APOPTOSIS REPRESSOR BCL-2 OR ITS ADENOVIRUS HOMOLOG E1B 19K PROTEIN. INDUCES THE RELEASE OF CYTOCHROME C, ACTIVATION OF CASPASE-3, AND THEREBY APOPTOSIS.

-i- SUBUNIT: FORMS HOMODIMERS AND HETERODIMERS TOGETHER WITH BCL-2, E1B 19K PROTEIN, BCL-X(L), MCL-1 AND A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=93364978; PubMed=8358790; Oltvai Z.N., Milliman C.L., Korsmeyer "Bcl-2 heterodimerizes in vivo with a accelerates programmed cell death."; Cell 74:609-619(1993).

SUBCELLULAR LOCATION: Membrane-bound (Potential).
DEVELOPMENTAL STAGE: DEVELOPMENTAL REGULATION ONLY OCCURS IN
BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADPOLES AND
ADULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

bc1-x long - mouse
C:Species: Mus musculus (house mouse)
C:Date: 02-Jul-1996 #sequence_revision 02-Jul-1996 #text_change 16-Jul-1999
C:Accession: 149056; S52866
R:Fang, W.; Rivard, J.J.; Mueller, D.L.; Behrens, T.W.
J. Immunol: 153, 4388-4398, 1994
A:Title: Cloning and molecular characterization of mouse bc1-x in B and T lymphc
A; Reference number: 149055; MUID:95052604; PMID:7963517
A; Accession: 149056
A; Status: preliminary; translated from GB/EMBL/DDBJ
A; Molecule type: mRNA
A; Residues: 1-33 (RES>
A; Cross-references: EMBL:U10101; NID:9506647; PIDN:AAA82173.1; PID:9506648
R; Kamesaki, H.; Michaud, G.Y.; Takatsu, K.; Okuma, M.
submitted to the EMBL Data Library, November 1994
A; Description: IL-5 inhibits anti-IgM-induced apoptosis in an immature B cell li
A; Reference number: $52866
A; Experimental source: embryonic; brain
A; Accession: S51762
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-125,189-233 <MI2>
A; Cross-references: EMBL: X82537; NID: g607176; PIDN: CAA57887.1;
A; Experimental source: embryonic; brain
A; Note: smaller form due to splicing
C; Genetics: 125/3
A; Introns: 125/3
C; Superfamily: bcl transforming protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                      망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein can be used to elucidate apoptosis mechanisms in reproductive other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic prot with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular
                                                                                                                                                                                                         reproductive tissue; uterine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok

                                                                                                                                        protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                    This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH3i variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok

The sequences can be used for determining continuous continuous associated with an ORFX-associated disorder. The coleic acids can be used to express ORFX proteins in gene therapy cectors. The proteins and nucleic acids may be used to treat cancers, coroliferative disorders, neurodegenerative disorders, osteoarthritis, coroliferative disorders, neurodegenerative disorders, osteoarthritis, corretension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, corolies, aplastic anaemia, burns, wounds, bone and cartilage damage, coccurral haemoglobinuria, antiinflammatory disease; to enhance constructive.

Coding sequences for Box or BH31 variants of comprehent, of the invention. Coding sequences for Box or BH31 variants of comprehent, of the invention. Coding sequences for Box or BH31 variants of comprehent, or the invention of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there can observe the cell population of reproductive tissue, e.g. uterine, testicular cancinomas of the cervix. Cell killing induced by Box can be suppressed by co-expression with selective anti-apoptotic Bc1-2 proteins. The Box context tissues, and provide a means for manipulating apoptosis. The Box context tissues, and provide a means for manipulating apoptosis. The Box context tissues, and provide a means for manipulating apoptosis. The Box context and transgenic animal are also useful for identifying ligands or constitutes. Modulation of the gene activity in vivo is useful for complylaxis and therapy of, e.g. cancer and other proliferative context based on expression. Identification of Box as new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Дb

                                                                                                        protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                           protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bot 2 proteins. The Bok protein and be suppressed by co-expression with selective anti-apoptotic Bot 2 proteins. The Bok
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mammalian Bok (Bcl-2-related protein and its related gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ovarian carcinoma;

                                                                 Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention ar sequences AAF22032 - AAF22040 and AAB59129 which are used in the isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agoni or antagonist sequences exhibit cytostatic; immunosuppressive; noottopic; neuroprotective; antivital; antiallergic; hepatotropic;
antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences,

The invention provides nucleic acid molecules (NAM1) encoding 4 human Bcl-2-like polypeptides (PEP1). The NAM1 and PEP1 may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Bcl-2-like polypeptides' expression. The NAM1 may be used to produce the soluble Bcl-2-like polypeptides by standard recombinant methodolgy. The polypeptides may also be used as antigens in the production of antibodies against Bcl-2 and in assays to identify modulators of Bcl-2 expression and activity. The anti-Bcl-2 antibodies and antagonists may be used to down regulate expression and activity.

capable of detecting 1000 or more genes from Drosophila. The inventuation of the capable of detecting 1000 or more genes from Drosophila. The inventuation is developmental biology and in elucidating cell signalling cell—cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                               capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01876-ABL30511), expressed DNA sequences (ABL01870-ABB72072).
          specification, but was obtained in electronic
at ftp.wipo.int/pub/published_pct_sequences.
